

ISOLINA FLAX INSULATION CUTTING INSTRUCTIONS

Larger volumes:

For best results, cut products with a straight (toothless) bladed bandknife. Alternatively, clamp the insulating material between boards and cut to the required size or shape by means of an angle grinder (available at all building sites) fitted with a toothless metal cutting disc of appropriate diameter.

For smaller volumes:

By means of the [special handsaw](#) that finally makes the manual cutting of all flax products a breeze. It is both inexpensive and durable. Really small amounts of thin insulation products can be cut with a general wavy blade insulation knife or simply by hand with ordinary scissors.

TIP: Fewer seams mean better overall insulation results;
shapes perfectly fitting the space of installation can be cut in one piece.
